

Virtual Digipass – how to use it

How to use it?

The operating mode of such a solution is extremely easy for the end user, as you can see below:

1. The user that (temporary) lost his Digipass goes to the corporate website that allows him to request a One Time Password. He enters his UserID and either a password or a pass phrase, depending on the corporate security policy.
2. After a short moment (depending on the Telco provider) he will receive a message containing the One Time Password he needs to login on his mobile phone.
3. Then he can log into his regular remote application as safely as usual, with no additional helpdesk request.

The security team can ask this user to perform some other tasks in order to get authenticated (calling an ISV server for example).
